IPv6 Google Apps Page

If you have IPv6 connectivity, you can visit my IPv6 page at http://ipv6.lahoud.fr.

For information, Google provides IPv4-only and IPv6-only targets, for special-purpose applications that require a specific protocol version. The available CNAME targets are:

```
ghs.google.com: Automatic (default)
ghs4.google.com: IPv4 only
ghs6.google.com: IPv6 only => configuration for ipv6.lahoud.fr
ghs46.google.com: IPv4 and IPv6
```

Here is for example an extract of my DNS zone file:

```
www 10800 IN CNAME ghs.google.com.
samer 10800 IN CNAME ghs.google.com.
ipv6 10800 IN CNAME ghs6.google.com.
```

Notice that `ipv6.lahoud.fr` is bound to `gh6.google.com` therefore it is only reachable when having IPv6 connectivity.

Using the test button form [[http://ipv6-test.com | ipv6-test.com], here is how you connect to my blog:
